-:- COFACTOR: Binds 1 magnesium ion per subunit (By similarity).
-:- ENZYME REGULATION: In contrast to yeast cyclase, S.pombe cyclase is not likely to be regulated by RAS proteins.
-:- SIMILARITY: Belongs to the adenylyl cyclase class-3 family.
-:- SIMILARITY: Contains 21 leucine-rich (LRR) repeats.
-:- SIMILARITY: Contains 1 PP2C-like domain.
-:- SIMILARITY: Contains 1 Ras-associating domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9.3%; Score 92; DB 1; Length 1692; 24.7%; Pred. Bacteria; Spirochaetes; Spirochaetales; Spirochaetaceae; Borrelia.
NCBI_TaxID=139;
CATALYTIC ACTIVITY: ATP + acetate = ADP + acetyl phosphate.
                      -!- PATHWAY: Conversion of acetate to acetyl-CoA; first step. -!- SUBCELLULAR LOCATION: Cytoplasmic (8y similarity). -!- SIMILARITY: Belongs to the acetokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 401;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Smith H.O., Venter J.C.;

-!- CATALYTIC ACTIVITY: ATP + oxaloacetate = ADP + phosphoenolpyruvate
                                                                                                                                                                                                             -:- PATTWAY: Rate-limiting gluconeogenic enzyme.
-:- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-:- SIMILARITY: Belongs to the phosphoenolpyruvate carboxykinase [ATP]

/dote="Vector: pBBcDNASfiAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. CDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_LIB=QH_ABCDI sunflower RHA801

// Cone lib="GG EFGHL lettuce serricola"
// Cone lib="GG EFGHL lettuce serricola"
// Cone service sources of RNA from a single genotype.
Separate cDNAs were generated using primers that
incorporated unique 5' and 3' tags to distribuish each
source of RNA. CDNAs were then pooled, size-fractionated,
directionally cloned into a custom medium-copy vector and
cransformations made with four size classes to minimize
size bias. Details of each source of RNA and library
construction can be obtained at http://cgpdb.ucdavis.edu/

were collected and pooled from several plants and frozen immediately after harvesting in liquid nitrogen. The CDNA was prepared using an Xhol-poly(dT) linker-primer. An EcoRI adapter was lighted to the blunt end cDNA and the products were digested with EcoRI and Xhol enabling directional cloning into the lambda ZAP Express vector. The library was amplified using the bost strain XLI-Blue MRF' Mass excision of the library was performed to obtain pBK-CMV phagemid clones in the host strain XLOLR. Single pass DNA sequencing was performed using the T3 promoter primer: 5' ATTAACCTACTAAAAGGGA 3' This library was constlucted by Alex Alchman." I others
